
PROBLEM DEFINITION

From reactive care to *proactive intelligence*

A centralised analytics solution for monitoring injury trends, treatment costs, and recovery outcomes across clubs, events, and regions.

BACKGROUND

AthleteX Care is the medical and performance unit responsible for managing athlete health across multiple sports clubs, events, and regions.

Medical staff are logging injuries at the club level, but leadership has no centralised way to monitor trends, identify high-risk injury types, or measure whether rehabilitation protocols are working. Decisions about treatment investment and injury prevention are being made reactively — after athletes go down — rather than proactively.

CORE BUSINESS QUESTIONS

- 01 Are injury rates increasing or decreasing year over year, and which months are the most dangerous?
-

- 02 Which injury types cost the most to treat — and are those the same ones taking athletes the longest to recover from?

- 03 Are athletes returning to play on time, or are estimated recovery timelines consistently being missed?

- 04 Which age groups and genders carry the highest financial burden, and should prevention resources be reallocated?

- 05 Is the reinjury rate high enough to suggest that current rehabilitation protocols are failing?

- 06 Which sport events and competition levels are producing the most severe and costly injuries?

DEFINITION OF SUCCESS

The medical director can open the dashboard at the start of any week, select a year, and immediately know where the organisation stands on injuries, spend, and recovery — compared to the same period last year.

Every insight needed to make an intervention decision is available within two clicks. No reports requested. No waiting.
